

Adjust Painting & Prep Hours

Manually adjust painting hours and prep time on individual substrates when automatic calculations need fine-tuning.

PaintScout calculates painting hours automatically from production rates, but you can manually adjust both painting and prep hours on any substrate when the automatic calculations need fine-tuning.

How do you adjust painting and prep hours?

1. Click the substrate you want to adjust.
2. Make your adjustments in the provided fields:

Edit Surface

Things to Note

- The system doesn't automatically calculate prep time; you must add and adjust prep time manually.
- If the variables used in your rate calculation don't involve hours (e.g., sqft/hr, item/hr, etc.), painting hours will not be automatically calculated. In such cases, you'll need to input the hours manually.

Related articles

Adjust Surface Dimensions

Override area dimensions on individual surfaces by editing length, width, height or switching to direct sqft/lmft input.

Adjust Number of Coats

Adjust the number of paint coats for individual surfaces using the coats dropdown after configuring rates in account settings.

Prep Hours

Manually add prep hours to substrates in estimates with automatic cost calculation based on your internal hourly rate.

Calculate Your Hourly Rate

Calculate your all-in hourly rate for painting estimates by combining labor wages, materials, overhead costs, and profit margin with step-by-step examples.
